

BhashaSakha

Live speech capture, translation, playback, and session intelligence

React + Vite

Express API

Supabase + AI

Purpose

BhashaSakha is a web application that turns live speech into readable captions, translated text, and optional translated audio. It saves every conversation as a session, supports shareable live links, and gives teams a post-session workspace for review, editing, and export.

Workflow fit

General conversations, interviews, and banking-focused service workflows.

Key Value Proposition

- Reduces language friction in live conversations without requiring separate capture, translation, and note-taking tools.
- Combines real-time viewing, saved session history, editing, export, and audio playback in one workflow.
- Adds governance layers such as subscriptions, model selection, quotas, routing, and audit-friendly domain

Core Features

- Browser speech recognition with interim captions, phrase-based segment saving, and optional automatic source-language detection.
- Real-time translation into multiple target languages with per-line text-to-speech playback and voice preferences.
- Saved session dashboard, live canvas, public viewer mode, transcript editing, and TXT or VTT export.
- Session modes for general, interview, and banking scenarios.
- Banking workflow detects sensitive entities, stores redacted risk items, and can generate a structured AI case form from the transcript.
- Usage, plan, and model-selection pages plus an admin console for AI providers, models, routing, entitlements, settings, flags, and logs.

Architecture

The current repo implements a browser-first frontend, an Express API layer, a Supabase-backed data plane, and a provider-routed AI layer for translation, text generation, and TTS.
